G SPLICER CORP.

PROFESSIONAL SPLICERS

The new G splicers are favored splicers of the motion picture, TV, microfilm and laboratory dark room fields throughout the world. And for good reason. No other splicer offers the **MADE IN U.S.A. CRAFTSMANSHIP, LOWER COST, MODERN DESIGN,** quality performance, ease of operation, and trouble free maintenance, **INCLUDING INDIVIDUALLY REPLACEABLE FRONT AND REAR PERFORATORS AND G BLADES.**

With the **DROP-IN POSITIONING PINS** you simply lay the film down into the recessed splicing channel and pull the tape (from **THE MULTI-ROLL DISPENSER**) across the open splice. Then, with a

single stroke of the **SOFT TOUCH HANDLE**, the tape is perforated and cut to conform with the film. You can make butt, diagonal or overlap splices (see Kodak bulletin H-50-8) with equal precision and in record time. Where necessary, dissimilar film bases can be spliced together.

The product line now features frame-line-to-frame-line splicing capability, (EVEN IN 35MM & 70 MM MODELS) using G splicing tape, the strongest, most optically clear tape available. You see nothing passing thru the frame, even with the highest resolution projection or TV broadcast equipment.

MULTITAPE ROLL CAPABILITY

The rolls of tape, always ready for splicing, can be switched back & forth with a touch of a finger. Clear

or white is available as needed.

"SOFT TOUCH" ALUMINUM HANDLE

Built-in cam...does away with loose pieces or rollers. Gives shorter and faster action without finger or

palm injury.

POSITION LOCKED CUTTER BAR

Separate locking screw under splicer, sets against adjusted cutter bar to maintain the adjustment

against any movement or vibration.

G SPLICERS REPAIR BROKEN FILM AND TORN SPROCKET HOLES..... WITHOUT FRAME LOSS

OPERATING INSTRUCTIONS

IMPORTANT — These instructions are to be used in conjunction with the G SPLICER USERS MANUAL. Numbers used to designate parts refer to the numbers used on the schematic drawing.

1. NOTE ON TAPE

The strip of splicing tape on the matrix prevents the small rectangles of splicing tape punched out by the perforators from sticking to the film. Replace this tape periodically. **Do Not Remove It.**

2. TO CUT FILM

Use Cutter (18A) for Straight, (18B) for Diagonal. Set Film on Matrix (6). Lower the Cutter. In 35mm, the cut occurs between perforations. In 16mm, at center of perforations. See Fig. 1 & 2.

FIGURE 1 16MM CUT

FIGURE 2. 35MM CUT

3. TO SPLICE FILM

Place Film Ends At Center of Matrix. Draw the tape over the film across the Matrix and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure on all points where the tape contacts the Splicer. Close splicer and depress Lever (4). Open Splicer and carefully remove spliced film. For picture film, repeat operation on reversed side, for Fullcoat Magnetic Film, splice one side only.

4. TO ADJUST

If, after placing film in Matrix for splicing, the film ends overlap or are too far away from each other, re-position the Film Cutter Assembly by turning screws (18 S · D) inward to correct for an overlap, outward for a gap.

FOR MICROFILM SPLICERS

1. Place the two films to be spliced at center of **MATRIX (A)**.
2. Lower the two film **HOLD DOWN PADS (B)**.
3. Draw the tape over the film across the **MATRIX (A)** and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure on all points where the tape contacts the splicer.
4. Close the splicer and depress **LEVER (C)** as far as it will go.
5. Open the splicer. Raise the film **HOLD DOWN PADS (B)**. Repeat the operation on the reverse side of the film.

FOR LABORATORY SPLICERS

1. Place the two films at center of **MATRIX (A)**. Slide the film across the **MATRIX** until you hit **CENTER SPRING PIN (D)**.
2. Lower the two film **HOLD DOWN PADS (B)**.
3. Draw the tape over the film across **MATRIX (A)** and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure where the tape contacts the splicer.
4. Close the splicer and depress **LEVER (C)** as far as it will go.
5. Open the splicer. Raise film **HOLD DOWN PADS (B)**. Lift film with protruding tape and by using thumb and forefinger wrap the tape around the film making an overlap joint. The tape should then be firmly pressed together using two fingers.

OPERATING INSTRUCTIONS

IMPORTANT — These instructions are to be used in conjunction with the G SPLICER USERS MANUAL. Numbers used to designate parts refer to the numbers used on the schematic drawing.

1. NOTE ON TAPE
The strip of splicing tape on the matrix prevents the small rectangles of splicing tape punched out by the perforators from sticking to the film. Replace this tape periodically. Do Not Remove It.

2. TO CUT FILM
Use Cutter (18A) for Straight, (18B) for Diagonal. Set Film on Matrix (6). Lower the Cutter. In 35mm, the cut occurs between perforations. In 16mm, at center of perforations. See Fig. 1 & 2.

3. TO SPLICE FILM
Place Film Ends At Center of Matrix. Draw the tape over the film across the Matrix and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure on all points where the tape contacts the Splicer. Close splicer and depress Lever (4). Open Splicer and carefully remove spliced film. For picture film, repeat operation on reversed side, for Fullcoat Magnetic Film, splice one side only.

4. TO ADJUST
If, after placing film in Matrix for splicing, the film ends overlap or are too far away from each other, re-position the Film Cutter Assembly by turning screws (18 S/D) inward to correct for an overlap, outward for a gap.

FOR MICROFILM SPLICERS

- Place the two films to be spliced at center of MATRIX (A).
- Lower the two film HOLD DOWN PADS (B).
- Draw the tape over the film across the MATRIX (A) and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure on all points where the tape contacts the splicer.
- Close the splicer and depress LEVER (C) as far as it will go.
- Open the splicer. Raise the film HOLD DOWN PADS (B). Repeat the operation on the reverse side of the film.

FOR LABORATORY SPLICERS

- Place the two films at center of MATRIX (A). Slide the film across the MATRIX until you hit CENTER SPRING PIN (D).
- Lower the two film HOLD DOWN PADS (B).
- Draw the tape over the film across MATRIX (A) and lower it into the tape groove. Smooth the tape down on the film and apply finger pressure where the tape contacts the splicer.
- Close the splicer and depress LEVER (C) as far as it will go.
- Open the splicer. Raise film HOLD DOWN PADS (B). Lift film with protruding tape and by using thumb and forefinger wrap the tape around the film making an overlap joint. The tape should then be firmly pressed together using two fingers.

"The Beavertail"
An Aluminum handle
made in U.S.A.
for perforating
splicers..

no loose cams to lose
no loose rollers to lose
no loose bearings to lose
Just a soft touch for splicing

LET'S GET A
HANDLE
ON.....

OLDER MODEL
SPLICERS.....
ONLY \$19.50

The CORE LOCK is a one piece unit with a built in latch - you just lock your adapter on your rewind equipment, and snap your film into place, you do not have to use a split reel or a flange and your hands are completely free. There can be no shifting, no jiggling, no problems with recalcitrant reels.. All in a single smooth operation.

The Automatic core lock is available in 16MM or 35 MM models for standard rewind 5/16" shafts. Also available for special shaft sizes. Only \$25.00

The amazing solvent cleaner that removes all traces of oil, grease, and fingerprints, plus small particles of tape, from your metal film splicer and leaves no residue.

- Non-Toxic • Non-Combustible
- Carries no electrical current
- Do not use on plastic
- 2 1/2 Oz. Bottle.....\$2.50

THE CORE LOCK
