THE INFORMATION CONTAINED IN THIS ADOBE ACROBAT PDF FILE IS PROVIDED AT YOUR OWN RISK AND GOOD JUDGMENT.

THese manuals are designed to facilitate the exchange of information related to cinema projection and film handling, with no warranties nor obligations from the authors, for qualified field service engineers.

If you are not a qualified technician, please make no adjustments to anything you may read about in these Adobe manual downloads.

WWW.FILM-TECH.COM
This Installation Guide explains how to install and set up the Digital Delay Feature for the XD10P. This feature allows you to make adjustments for D-cinema video playback using XD10P format EXT2.

The Digital Delay feature is available in XD10P Setup Software Version 1.00.26 or later. It operates with XD10P Cinema Audio Processors with serial number 2300 and above or with older units that have been upgraded with a “DO-80T” digital out (middle) board.

To replace the Digital Out board, please contact DTS Technical Service at techsupport@dts.com or (818) 706-3525 (within US) or (800) 959-4109 (outside US).

To download the XD10P Setup Software, go to the free DTS Online TechCenter located at http://www.dts.com/tech-center.html.

**Step 1: Check Connection**

Verify that your computer is connected to the XD10P in one of these two ways:

- The RS-232 port on the computer is connected to the XD10P with a serial cable
- A serial-to-USB adapter connects the USB port on the computer to the XD10P RS-232 port.

☑ Note: When the computer is connected to the XD10P, the Setup Software controls the system. The buttons and fader knob on the front panel of the XD10P will not respond to user interaction.

**Step 2: Load and Open Setup Software**

a. Load the XD10P Setup Software onto your computer.

b. Open the XD10P Setup Software by clicking the icon, shown at right, on your desktop or click on **Start -> Programs -> DTS -> XD10P**.

The opening screen, shown below, appears.

**Step 3: Check Version**

Check the setup software version number in the XD10P Setup Version field to verify that it is V1.00.26 (or above).

You can also check the version number by clicking on **Help** on the menu toolbar at the top of the screen.

The screen shown at right will appear, displaying the version number.
Step 4: Select Format

Select the Formats tab. The following screen will display.

Select EXT2 (Digital). The following screen will display, adding two panels to the Formats tab screen: Digital Delays and Digital Link Default.

Step 5: Adjust Format Level

Use the Format Level fader on the left side of the screen to adjust the format level for the EXT 2 Digital format. This pre-sets the level for this format.

The Main Fader at the top of the screen will move as you adjust the Format Level fader. The system will retain this setting until you change it.

Step 6: Select Power On Format

Select the default startup format (Power On Format) from the list shown on the screen above. This determines the format the XD10P will start in when it is powered on.

Stereo SR is the default Power On Format. When you select Last Selected, the XD10P will restart with the last format used before it was powered on.
Step 7: Set Digital Delays

Use the Input Delay fader and the Surround Delay fader, shown at right, to align the digital video sound with the digital video picture projected.

a. Set Input Delay

Use the **Input Delay** fader to set the time delay needed to compensate for the video projector you are using. The fader ranges from 0 ms to 100 ms. Consult the manual for the video projector you are using to get the exact delay recommended. Adjust this number if necessary.

- **Note:** Most DLP projectors require a delay of approximately 80 ms.

b. Set Surround Delay

Use the Surround Delay fader to set the delay for the surround channels when EXT 2 is being used for D-cinema (digital video). The fader ranges from 0 to 127 ms. The formula to determine the correct delay is:

\[(D2 – D1) + 20 = \text{surround delay in milliseconds}\]

1. Measure the distance (D1) from a selected **rear seat** to the nearest **surround speaker** (in feet). Note: If you are calculating in meters, multiply by 3 (m × 3) to convert to feet.
2. Measure the distance (D2) from the **same rear seat** to the nearest **screen speaker** (in feet). Note: If you are calculating in meters, multiply by 3 (m × 3) to convert to feet.
3. Subtract the two measurements to find the difference; then add 20 to that number. The result is the Digital Surround Delay value in milliseconds (ms). Using the digital slider, adjust the digital surround delay to that number.

- **Note:** When an XD10 player's “digital out” is connected to the XD10P's “digital in” and the XD10 is being used for film-based feature/trailer (DTS) soundtrack playback, the Surround Delay should be set to 0ms.

Step 8: Select Digital Link Default

You need to select a default format from the list on the panel when using the XD10P digital IN. This presets the format the XD10P will switch to if the digital link fails.

When using the XD10 and XD10P, in most cases the audio connection will be from the XD10 “analog OUT” to the XD10P “analog IN”. However, if the XD10 has the digital output card installed, the connection can be from the XD10 “digital OUT” to the XD10P “digital IN”.

- **Note:** If you are not sure whether the XD10 has the optional digital output card and audio connection is made to the XD10P's “digital in” and the XD10 is being used for film-based feature/trailer (DTS) soundtrack playback, the Surround Delay should be set to 0ms.

Traditionally with DTS products if timecode is lost, the DTS player will pulse the cinema processor to a default sound format. This is still true, but when using the digital input there is a chance for a digital link failure. If the digital link between the DTS player and XD10P is broken, but the DTS player is still receiving good timecode, the player will not trigger a fallback format, so the XD10P will experience a loss of audio. Therefore, it is necessary to set a fallback option in case of digital link failure.
Configure the default to one of the choices. In most cases, Stereo SR is correct. Also, the standard fallback must be set (on the external DTS player) for timecode failure. This is done on the XD10 through menu selection, or through the logic interface board on the DTS-6 and –6D. Refer to those product manuals for more information.
